

## CONSENT FORM ORAL CANCER SCENEING

COMPLETE FOR EACH PATIENT AND PLACE IN RECORDS OF PATIENT

In our practice, as your health care provider, we seek to provide you access to the newest and most effective scientific screening and treatment. In 2009 the StarDental Identafi system was introduced. This multispectral medical device greatly enhances our ability to find early signs of cancer and dysplasia in the mouth. Historically our practice has used white light in examination for oral cancer. The use of narrow band violet light and green-amber reflected light helps us detect in the oral tissue various problems including cancer lesions and dysplasia.

Early detection of oral cancer is important to being able to provide early treatment and avoidance of the problems which arise from late stage detection of oral cancer.

The Oral Cancer Foundation advises that one American dies every hour from oral cancer. Late detection of oral cancer is the primary cause that both the incidence and mortality rates of oral cancer continue to increase. As with most cancers, age is the primary risk factor for oral cancer. Tobacco and alcohol use are other major predisposing risk factors, but more than 25% of oral cancer victims have no such lifestyle risk factors. Recently scientists have established a connection between HPV viral infection in the mouth and the occurrence of oral cancer.

YES, I request that my clinician perform the StarDental Identafi examination. I accept financial responsibility for this examination if my insurance company does not pay.
